The present invention relates to adeno-associated virus serotypes. present sequence is the DNA sequence of one such serotype (AAV6). A can be used to contruct AAV viral vectors for use in gene therapy trange of disorders: cystic fibrosis, cancer, AIDS, atherosclerosis, sickle cell anaemia, thalassaemia, blood clotting disorders and dia

and diabetes.

for a

Adeno-associated virus serotype 6 and viral vector derived from it gene therapy of cystic fibrosis, cancer, acquired immunodeficiency syndrome, sickle cell anemia, thalassemia and diabetes.

The invention relates to an expression construct comprising a nucleic cacid sequence encoding an adeno-associated virus integration efficiency celement (AAV IEE), which is devoid of AAV inverted terminal repeats (AAV IER), which is devoid of AAV inverted terminal repeats (AAV IER), which is devoid of AAV inverted terminal repeats (AAV IER) which is devoid of AAV inverted terminal repeats (AAV IER) which is cancer into a host cell chromosome when cexpression construct can be used as a therapeutic factor for treating a colon cancer, renal cancer, and cancer, blie duct cancer, bladder cancer, brain cancer, spinal chord cancer, bladder cancer, brain cancer, spinal chord cancer, bladder cancer, cervical cancer, prostatic cancer, endometrial cancer, esophageal cancer, leukemia, cell iver cancer, gastrointestinal cancer, laryngeal cancer, leukemia, cell cancer, prostatic cancer, retinoblastoma, ovarian cancer, sunach cancer, cesticular cancer, thymus cancer or thyroid cancer, other pathologic state includes inflammatory disease (arthritis), neurodegenerative cell disease, a disease of an organ attributed to the presence of increased or cervresponds to the AAV serotype 6 complete DNA including the IEE

```
The present invention describes a polynucleotide (I), comprising CC parvovirus rep coding sequences and parvovirus cap coding sequences. The CC parvovirus, and a capsid interacting domain from a first CC parvovirus, and a capsid interacting domain from a parvovirus different CC from the different parvovirus. Also described: (1) a vector comprises cC (I); (2) a cell comprising (I), or parvovirus rep coding sequences and CC parvovirus cap coding sequences, where the rep coding sequences and CC parvovirus different from the first parvovirus, the cap CC domain from a parvovirus different from the first parvovirus, the cap CC domain from a parvovirus different from the different parvovirus, and CC the rep coding sequences are stably integrated into the genome of the CC cell; and (3) producing a recombinant hybrid parvovirus particle or adeno CC stocks of hybrid parvoviruses or parvovirus which may be used in capsid in vaccines, and in CC gene therapy. The polynucleotide (I) can be used in producing higher CC stocks of hybrid parvoviruses or parvovirus vectors, which may be used in capsion. The polynucleotide may be used to produce a parvovirus vector may also be used to produce a parvovirus vector companies. The present sequence is used to provide an antisense nucleic cold to a cell in vitro or in vivo, or in diagnostic and screening CC present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                  The present sequence is an adeno-associated virus serotype 1 (AAV-1) DNA characterised by two inverted terminal repeats (ITR) and open reading frames for rep and capsid (cap) proteins. The rep reading frame encodes four proteins, Rep 38, Rep 68, Rep 52 and Rep 40, while the cap reading frame encodes three structural proteins, VP1, VP2 and VP3. The AAV-1 sequence or its fragments particularly ITRs, rep and cap coding regions, are useful in production of recombinant viral vectors for gene delivery. These vectors can be used as gene therapy vectors, vaccine vectors or antisense delivery vectors. The AAV-1 does not induce the formation of neutralising antibodies specific to any serotype of AAV hence is useful for transforming host cells, and in the preparation of a medicament for the delivery of transgene to a host
                                                                                                                                                                                                                                                                         Claim 1;

The invention relates to a novel method for detecting adeno-associated virus (AAV) sequences in a sample, which comprises subjecting a sample containing a DNA to amplification via a polymerase chain reaction (PCR). The AAV sequence have the following activities: cytostatic, antipsoriatic, antirheumatic, antiarthritic, neuroprotective, antidiabetic, antithyroid, dermatological, and antiinflammatory. The AA antidiabetic, antithyroid, dermatological, and antiinflammatory.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  sequence can be used in gene therapy or as part of a vaccine to treat disorders. The method is useful in detecting and/or identifying AAV sequences and isolating novel sequences that are identified. The sequences may be used e.g. for preventing or treating hyperproliferative conditions such as cancers and psoriasis, and other autoimmune diseases like rheumatoid arthritis, multiple sclerosis, diabetes, autoimmune thyroiditis, scleroderma or Crohn's disease. This polynucleotide sequence

New expression construct comprising a nucleic acid sequence encoding adeno-associated virus integration efficiency element, useful for treating cancer e.g. lung cancer or colon cancer or inflammatory disc disease an

SEQ ID NO ω --62pp; English

The invention relates to an expression construct comprising a nucleic CC acid sequence encoding an adeno-associated virus integration efficiency CC element (AAV IEE), which is devoid of AAV inverted terminal repeats (AAV ITRs) and site-specifically integrates into a host cell chromosome when CC provided to the host cell in conjunction with an AAV Rep protein. The CC expression construct can be used as a therapeutic factor for treating a CC mammal for a pathologic state which is cancer, including lung cancer, CC colon cancer, renal cancer, anal cancer, bile duct cancer, bladder CC cancer, bone cancer, pastin cancer, spinal chord cancer, breast cancer, CC cervical cancer, gastrointestinal cancer, esphageal cancer, pastical cancer, gastrointestinal cancer, laryngeal cancer, pancreatic cancer, prostatic cancer, retinoblastoma, skin cancer, stomach cancer, CC cancer, prostatic cancer, retinoblastoma, skin cancer, stomach cancer, cesticular cancer, thymus cancer or thyroid cancer. Other pathologic state includes inflammatory disease (arthritis), neurodegenerative CC disease, a disease of an organ attributed to the presence of increased or decreased level of a particular gene product(s). This sequence

(1) can be used in vaccines, and in gene therapy. The polynucleotide (1) can be used in producing higher stocks of hybrid parvoviruses or parvovirus vectors, which may be used in the delivery of nucleic acids having biological effect to treat or ameliorate the symptoms associated with any disorder related to gene expression. The polynucleotide may be used to produce a parvovirus vector to express an immunogenic polypeptide in a subject, e.g. for vaccination. The parvovirus vector may also be used to provide an antisense nucleic acid to a cell in vitro or in vivo, or in diagnostic and screening methods. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a polynucleotide (I), comprising parvovirus rep coding sequences and parvovirus cap coding sequences. The rep coding sequences encodes a DNA binding domain from a first parvovirus, and a capsid interacting domain from a parvovirus different from the first parvovirus. The cap coding sequence comprises sequences from the different parvovirus. Also described: (1) a vector comprising (I); (2) a cell comprising or parvovirus rep coding sequences and parvovirus cap coding sequences, where the rep coding sequences encode a DNA binding domain from a first parvovirus and a capsid interacting domain from a parvovirus different from the first parvovirus, the cap coding a parvovirus different from the first parvovirus, the cap
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polynucleotides comprising parvovirus rep coding sequences and parvovirus cap coding sequences, useful in producing higher stocks hybrid parvovirus vectors for delivering therapeutic nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 4718 BP; 1121 A; 1393 C; 1273 G;

The AVV genes may be derived from viruses AAV1, AAV2, AAV3, AAV4, AAV5 and AAV6. The methods of the invention may be useful for generating recombinant vectors with high efficiency and no need of reconfiguration. The current sequence is that of the Adeno-associated virus 2 (AAV2) rep-Adeno-associated virus 1 (AAVI) cap fusion

```
The invention relates to a recombinant herpes simplex virus (HSV) C characterized in that its genome is inserted with a DNA sequence selected from nucleotide sequences of ADZ46594-ADZ46598 or their homologous contains the construction of DNA fragments that contains sequences ADZ46594-C ADZ46598, and respectively inserting these 5 DNA fragment they (comprising the C ADZ46598, and respectively inserting these 5 DNA fragment they, establishing a one-c strain vector cell i.e. recombinant AAV vector cell-line, infecting the corresponding vector cell-line with the 5 recombinant HSV, producing corresponding vector cell-line with the 5 recombinant HSV, producing corresponding vector cell-line with the 5 recombinant HSV, producing corresponding vector cell-line with the 5 recombinant HSV, producing corresponding vector cell-line with the 5 recombinant HSV, producing corresponding vector cell-line, separating and purifying the 5 serotype recombinant C AV after lysing the AAV-containing cells and culture liquor to give a crude lysate and further purification of rAAV by density-gradient centrifugation or affinity chromatography) and a recombinant vector centrifugation or affinity chromatography) and a recombinant vector centrifugation or affinity chromatography) and a recombinant vector centrifugation or affinity chromatography) and a recombinant vector centrifugation with immediate-early enhancer and promoter of containing cells and culture liquor to give a crude lysate and spolyclonal site and a polyA signal respectively. The DAAV-G genome with immediate-early enhancer and promoter of centressing cassette at outer edge of ITR). The DAA sequence is inserted cuto XbaI site in UL2 or UL44 gene in HSV genome. The DAA sequence of sequence ADZ46594-ADZ46598 can also be inserted into other non-essential centres axe of cuto xbaI sequence of sequence and wide spectrum of cell infection, even non-cleaved cells and runsers and neural diseases. The virus vectors are safe, with long centres axonal conduction through the incorporated 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

```

The invention relates to a novel recombinant herpes simplex virus (rHSVS) whose genome is respectively inserted by the Adeno-associated virus (AAV) rep gene and cap gene. The AVV genes may be derived from viruses AAV1, AAV2, AAV3, AAV4, AAV5 and AAV6. The methods of the invention may be useful for generating recombinant vectors with high efficiency and no need of reconfiguration. The current sequence is that of the Adeno-associated virus 2 (AAV2) rep-Adeno-associated virus 1 (AAV1) cap fusion DNA (SEQ ID 1) of the invention.

The invention relates to a recombinant herpes simplex virus (HSV) characterized in that its genome is inserted with a DNA sequence selected from nucleotide sequences of ADZ46594-ADZ46598 or their homologous sequences. Also included are preparing the recombinant HSV (comprising the construction of DNA fragments that contains sequences ADZ46594 and respectively inserting these 5 DNA fragments into genome of HSV by applying genetic engineering to give the recombinant HSV), large-scale production of 5 serotype recombinant adeno-associated viruses (AAV) 1, 3, 4, 5, and 6 (by preparing the recombinant HSV, establishing a one-strain vector cell i.e. recombinant AAV vector cell-line, producing recombinant AAV under the infective effect of the 5 recombinant HSV in the vector cell-line, separating and purifying the 5 serotype recombinant AAV after lysing the AAV-containing cells and culture liquor to give a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Large-scale production, isolation and purification of serotype adenoses
associated virus vectors by infecting cells with recombinant herpes
simplex virus vectors, for use in gene therapy of e.g. cancer and
respiratory diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Genetic engineering; gene therapy; vector; cancer; neoplasm; cytostatic; respiratory disease; respiratory-gen.; neurological disease; neuroprotective; ds.

ф S 뮹 S 밁 δ В Ś 밁 δ 뮍 Ś g Ş Вb Š 밁 δ В á S 멍 Ś 밁 δ cc crude lysate and further purification of rAAV by density-gradient cc centrifugation or affinity chromatography) and a recombinant vector plasmid pSNAV-NX (containing ITR at both ends of AAV-1, AAV-4, AAV cytomegalovirus, and a polyclonal site and a polyA signal, respectively, cc between the ITR (inverted terminal repeat), and neomycin-resistance genecy expressing cassette at outer edge of ITR). The DNA sequence is inserted into XDaI site in UL2 or UL44 gene in HSV genome. The DNA sequence of sequence ADZ46594.ADZ46598 can also be inserted into other non-essential cytic or the vectors are for use in gene therapy of e.g. cancer, respiratory complete and neural diseases. The virus vectors are safe, with long cexpression time and wide-spectrum of cell infection, even non-cleaved cells and reverse axonal conduction through the incorporated HSV-AAV cyc sequence rep2capl for the AAV/HSV vectors of the invention.                                                                                                                                                                                                                                                     The invention relates to a novel method for detecting adeno-associated virus (AAV) sequences in a sample, which comprises subjecting a sample containing a DNA to amplification via a polymerase chain reaction (PCR). The AAV sequence have the following activities: cytostatic, antipsoriatic, antithyroid, dermatological, and antinflammatory. The AAV sequence can be used in gene therapy or as part of a vaccine to treat disorders. The method is useful in detecting and/or identifying AAV sequences and isolating novel sequences that are identified. The sequences may be used e.g. for preventing or treating hyperproliferative conditions such as cancers and psoriasis, and other autoimmune diseases like rheumatoid arthritis, multiple sclerosis, diabetes, autoimmune thypotherical or Crohn's disease. This polynucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting adeno-associated virus sequences in a sample, useful for preventing or treating hyperproliferative or autoimmune diseases, comprises subjecting a sample having a DNA to amplification via polymerase chain reaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antiarthritic; neuroprotective; antidiabetic; antithyroid; dermatological; antiinflammatory; gene therapy; vaccine; hyperproliferative; cancer; psoriasis; autoimmune disease; rheumatoid arthritis; multiple sclerosis; diabetes; autoimmune thyroiditis; scleroderma; Crohn's disease; gene;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gao
